Focused sensitivity analysis: A.1.2 coordinator roles

Indicator-relevant strong evidence with and without five low-quality controls

Design and analytical distinction

The experiment isolated indicator A.1.2, which assesses whether the coordinator's role is known and identified. Instead of drawing on every strong record in the evaluation set, the control-free bank contained only the five evaluation records rated strong and assigned by Stage 1 to the relevant A.1 Roles subdimension. The treatment contained these identical five records plus five low-quality A.1.2 controls. The scoring scope, frozen Stage 2 P5 prompt, model, temperature (0), schema and validation procedure were held constant. Neutral EV-#### identifiers concealed record type. The evidence-strength classification was made by the researcher for this sensitivity analysis.

Positive justification use and contrary/limiting use were analysed separately. A control counted as positive contamination only if it appeared in evidence_supporting_score. A control appearing solely in contrary_or_limiting_evidence was treated as a limiting reference, not as justification for maturity.

Matched result

Condition	Evidence bank	Phase	Strong evidence used	Control role
Original full-pipeline final	622 genuine records	3	Context only	Not applicable
Matched control-free	5 relevant strong records	2	5/5 (100%)	No controls
Matched treatment	Same 5 strong + 5 controls	2	5/5 (100%)	0 positive; 5 limiting

The phase remained Phase 2 after control injection. All five relevant strong records were retained in the positive justification in both conditions (100% use and 100% overlap). None of the five controls entered the positive support set (0%); all five were assigned exclusively to contrary or limiting evidence (100%).

Role assigned to each control

Evidence ID	Control construction	Positive use	Assigned role
EV-0002	Future Possibility	No	Contrary/limiting evidence
EV-0003	Presentation Attendance	No	Contrary/limiting evidence
EV-0005	Generic External Comment	No	Contrary/limiting evidence
EV-0006	Agenda Mention	No	Contrary/limiting evidence
EV-0010	Glossary Reference	No	Contrary/limiting evidence

Interpretation

For this indicator, low-quality evidence did not contaminate the justification, displace relevant strong evidence, or alter the phase score. Evidence-bank composition changed the wording of the explanation and populated the limiting-evidence field, but the positive evidence set was stable: five of five strong records were used in both conditions. The original Phase-3 result is contextual rather than part of the causal contrast because the full 622-record bank contained additional evidence unavailable in either matched condition. The causal comparison is therefore Phase 2 versus Phase 2. This one-indicator case study supports robustness to low-quality injection for A.1.2, but it does not establish the same behaviour for every DEMA indicator.

Verbatim comparison of requested Stage 2 output

The following fields are reproduced exactly from the validated JSON outputs; spelling, evidence IDs and wording have not been edited.

Original final pipeline output (622-record bank)	Focused treatment output (5 strong + 5 controls)
phase_score: 3 **score_reasoning:** The Agence nationale de la protection civile (ANPC) is repeatedly and explicitly identified as the national coordinator for disaster risk management and data ecosystem activities in Togo (V4ID-0014, V4ID-0064, V4ID-0075, V4ID-0124, V4ID-0251, 028_chunk_002_pages_011-020::E006, 029_chunk_001_pages_001-010::E002, 029_chunk_003_pages_021-030::E017). The ANPC is described as having a formal mandate, being resourced for coordination, and organizing platform meetings and operational activities. The national strategy and contingency plans assign the ANPC the role of coordinating interventions, supported by the CNOU and sectoral actors. There is evidence of periodic meetings, operational capacity strengthening, and formal assignment of coordination responsibilities. However, there is no evidence that the institutional framework is fully endorsed and operationalized (Phase 4), nor that all relevant ministries and important data producers are systematically incentivized to participate in organized activities. Recommendations for further clarification of mandates and operationalization (V4ID-0044) and the absence of evidence for ecosystem-wide harmonization or incentivized participation limit the score to Phase 3. The principal strength is the clear, formal identification and resourcing of the coordinator. The principal weakness is the lack of evidence for full operationalization, harmonization, and incentivized, ecosystem-wide participation. **contrary_or_limiting_evidence:** ["V4ID-0044"] **contrary_or_limiting_reasoning:** V4ID-0044 recommends further clarification of mandates and organizational structures for the ANPC and other institutions, indicating that the operationalization and harmonization of the coordinator role is not yet fully achieved.	**phase_score:** 2 **score_reasoning:** The evidence establishes that ANAMET (Agence Nationale de la Météorologie) is recognized as a national provider of meteorological and climate data, producing and disseminating information to decision-makers and the public at the start of each rainy season (EV-0001). A newly validated national document maps actors involved in meteorological data collection and dissemination, with ANAMET as the technical authority and other entities such as ASECNA, ITRA, CTOP, ICAT, and the maritime prefecture identified as producers (EV-0004). ANPC (Agence Nationale de la Protection Civile) is documented as coordinating post-catastrophe evaluation missions in collaboration with sectoral actors (EV-0007), and a roster of national experts with specialized roles is provided (EV-0009). The ECOWAS Early Warning Directorate and WANEP-TOGO are also identified as actors with defined roles in the ecosystem (EV-0008). These records show that key actors and coordinators are identified and that informal coordination and collaboration occur, particularly in response to events. However, none of the evidence demonstrates formal institutional arrangements, regular or incentivized activities to promote data exchange, or government incentives for broad participation. No evidence supports managed, formal, or incentivized coordination, nor does it demonstrate operationalization or ecosystem-wide coverage. Several items (EV-0002, EV-0003, EV-0006, EV-0010, EV-0005) reference topic exposure, agenda items, or glossary mentions but do not document implementation, institutionalization, or outcomes. Therefore, the highest fully supported phase is Phase 2 (Recognized but reactive), as the coordinator is identified and stimulates informal data sharing, but institutional arrangements and regular activities are not demonstrated. **contrary_or_limiting_evidence:** ["EV-0002", "EV-0003", "EV-0006", "EV-0010", "EV-0005"] **contrary_or_limiting_reasoning:** EV-0002, EV-0003, EV-0006, EV-0010, and EV-0005 reference topic exposure, agenda items, or glossary mentions but do not document implementation, institutionalization, or outcomes. No evidence demonstrates formal institutional arrangements, regular activities, or government incentives for broad participation. No evidence supports managed, formal, or incentivized coordination, nor does it demonstrate operationalization or ecosystem-wide coverage.
